```

DNSManager is a client that provides user with a rich GUI to manage their domain records

BRIFE
DESCRIPTION

FUNCTIONALITY

Users often have their domains hosted in different registers such as **godaddy**, **digitalocean**, **cloudflare** and so on. They need to login in on different registers' websites to make changes to their domain records.

DNSManager is such a client that users can just manager all their domains in one place. This client only needs API keys.

DEMO

FURTHER DEVELOPMENT

If we have extra time, we can develop a SSL certificates manager module to help manage SSL certs by using OPENSSL framework and Let's Encrypt.

```
object to mirror
mirror_mod.mirror_object

operation == "MIRROR_X":
    mirror_mod.use_x = True
    mirror_mod.use_y = False
    mirror_mod.use_z = False
operation == "MIRROR_Y":
    mirror_mod.use_x = False
    mirror_mod.use_y = True
    mirror_mod.use_z = False
operation == "MIRROR_Z":
    mirror_mod.use_x = False
    mirror_mod.use_y = False
    mirror_mod.use_z = True

#selection at the end -add
mirror_ob.select= 1
modifier_ob.select=1
context.scene.objects.active
("Selected" + str(modifier_ob
mirror_ob.select = 0
= bpy.context.selected_object
data.objects[one.name].select
print("please select exactly

-- OPERATOR CLASSES --

types.Operator):
    X mirror to the selected
    object.mirror_mirror_x"
    mirror X"
```

Q&A

```
object to mirror  
mirror_mod.mirror_object
